                                                                                                                                                                                                                                       proteins.";
Submitted (NAY-2000) to Swiss-Prot.
-- FUNCTION: This protein promotes the GTP-dependent translocation of the nascent protein chain from the A-site to the P-site of the ribosome (By similarity).
-- SUBCELLULAR LOCATION: Cytoplasmic.
-- SIMILARITY: Belongs to the GTP-binding elongation factor family.
                                                                                                                                                                  STRAIN=JRS4 / Serotype M6;

MEDITRE-22458139; PubMed=12571056; MEDITRE-22458139; PubMed=12571056; DOI=10.1128/AEM.69.2.1270-1275.2003; Gevera D., Danielsen M., Huys G., Swings J.; Dolecular characterization of tet(M) genes in Lactobacillus isolates from different types of fermented dry sausage."; Appl. Environ. Microbiol. 69:1270-1275.2003).

-!- FUNCTION: Abolishes the inhibitory effect of tetracyclin on protein synthesis by a non-covalent modification of the ribosomes (By similarity).

-!- SIMILARITY: Belongs to the GTP-binding elongation factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R InterPro; IPR000640; BEG_C.

"Molecular characterization of tet (M) genes in Lactobacillus isolates from different types of fermented dry sausage.";
Appl. Environ. Microbiol. 69:1270-1275 (2003).
-!- FUNCTION: Abolishes the inhibitory effect of tetracyclin on protein synthesis by a non-covalent modification of the ribosomes (By similarity).
-!- SIMILARITY: Belongs to the GTP-binding elongation factor family.
TetM/tetO subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; AX149577; AAN84401.1; -.

ALIGNMENTS

Modulating oxidative stress level in a cell, involves contacting the cell with an oxidative stress regulator selected from colostrinin, its constituent peptide, analog or their combinations. The present invention relates to a method for modulating the oxidative stress level in a cell or a patient, comprising contacting the cell with, or administering to the patient, an oxidative stress regulator selected from colostrinin, or its constituent peptide (e.g. the present peptide), to change the level of an oxidising species in the cell. The method can be used to treat oxidative damage to skin, by decreasing or preventing an increase in the level of damage to a biomolecule of the patient .. 0 Length 18 Indels Dermatological; oxidative stress regulator; colostrinin. 100.0%; Score 98; DB 4; I 100.0%; Pred. a proline rich polypeptide aggregate confained in colostrum. The peptides bave immune response modulatory activity, and are capable of inducing cytokines. Colostrinin and its derived peptides are useful for inducing cytokines production, for modulating an immunological response and for inducing blood cell proliferation. The peptides are useful in the treatment of disorders of the central nervous system, neurological disorders of the central nervous system, neurological disorders, mental disorders, dementia, neurodegenerative diseases, and that all actions and disorders of the immune system, bacterial and viral infections and acquired immunological deficiencies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the sequences of a number of peptides found in ewe's colostrinin. Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disorders such as senile dementia, Parkinson's disease, Alzheimer's disease, psychosis and neurosis, immune system disorders such as bacterial and viral infections, to improve the development of a child's immune system, as a dietary supplement, and to promote the dissolution of beta-amyloid plaques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method for promoting cell differentiation (e.g. neural cell differentiation). The method involves contacting cells with a neural cell regulator (i.e. a colostrinin peptide) in order to change the cells in morphology to form neural cells. Colostrinin is a proline-rich polypeptide aggregate that is present in colostrum. The method of the
                                                               Use of colostrinin, its constituent peptide or analog as a neural cell regulator, for promoting neural cell differentiation and treating damaged neural cells in a patient.
                                                                                                                              The present invention relates to a method for promoting neural cell differentiation and treating damaged neural cells, using colostrinin and colostrinin peptides (e.g. the present peptide) as a neural cell regulator. Colostrinin is a polypeptide complex found in colostrum

The present sequence is that of a colostrinin constituent peptide that is preferred for use as an immunological regulator and as a blood cell requlator in claimed methods of the invention. It is classified as having a crequistor in claimed methods of the invention. It is classified as having a cytokine in a cell by contact with an immunological regulator, where the cytokine in a cell by contact with an immunological regulator, where the coll is mammalian, including human; modulating an immune response in a cell by contact with the immunological regulator under conditions effective to induce a cytokine; modulating an immune response in a patient by administering an immunological regulator under conditions effective to induce a cytokine; where the immunological regulator is caministered topically or as part of a dietary supplement, and where the immune response is specific or non specific, an interferon response or an antibod cells with a blood cell regulator; where the blood cells are consecting consecting consecting consecting consecting consecting an immune remammalian or human, and and where the blood cells are increased in number or differentiated; and a
                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulation of blood cell proliferation in a patient involves use of blooc
cell regulator selected from colostrinin, its constituent peptide and/or
invention is useful for promoting the differentiation of cells and for treating damaged neural cells in a patient. The present amino acid sequence represents a specifically claimed colostrinin peptide used in the method of the invention

         cytokine-inducing composition comprises a pharmaceutical carrier and an active agent such as the present peptide. Cytokines induced by this peptide in human leucocyte cultures include interferon-gamma, tumour necrosis factor-alpha, interleukin-6 and interleukin-10. It was one of the best overall inducers in almost all cytokine and blood cell proliferation experiments conducted
modulating blood cell proliferation in a patent. A claimed

The modulator has cytostatic activity, and can be used as a 4HNE inhibitor. The modulator is useful in the manufacture of a medicament for reducing 4MR-protein adduct formation, inhibiting 4HNE-mediated glutathione depletion, inhibiting 4HNE-induced activation of p53 protein, and/or inhibiting 4HNE-induced activation of c-Jun NH2-terminal kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       colostrinin for e.g. modulating an intracellular signaling

regulator selected from colostrinin, its constituent peptide and/or analogue. The invention is used for modulating the oxidative stress level analogue. The invention is used for modulating the oxidative stress level corps. The invention is used for modulating the oxidative stress level corps. Or organism; or for treating oxidative damage to the skin of a patient e.g. animal or human; to modulate oxidative stress during/ after patient. Firth or normal birth, preventing/delaying aging in a patient, enhancing wound healing, and the reduction of side effects of cosmetic procedures. The method changes the level of an oxidising species in the cell, such as decreases or prevents increase in the level of damage to a biomolecule of the patient selected from DNA, protein and/or lipid, compared to the same conditions when the oxidative stress results in

Composition useful for the modulation of blood cell proliferation in a patient comprises a blood cell regulator selected from colostrinin, its constituent peptide and/or analog.

WPI; 2002-269151/31.

The invention relates to a composition which comprises a blood cell

The invention provides a method for the recovery of peptides (especially colostrinin) from colostrum in substantially pure, biologically active form and in high yield. The method involves mixing the colostrum with an alcohol to form an alcohol phase containing the colostrinin and a precipitate containing higher molecular weight caseins and other proteins. Best results are obtained using methanol or ethanol of at least 80% and preferably up to 100%, purity. The alcohol phase is then separated from the precipitate, and the colostrinin is separated from the alcohol, preferably by evaporation, to form a colostrinin-rich phase, which is recovered. A precipitation agent, such as ammonium sulfate, may be added to induce precipitation of the colostrinin peptides. The method is generally applicable to the separation of peptides from fluids containing higher molecular weight proteins, lipids, carbohydrates and/or nucleic
                                                                                                                                                                                                              ö
Colostrinin, or its constituent peptide or active analogue is useful for inhibiting apoptosis in a cell, protecting against DNA damage in a cell, or reducing the toxic effect of beta-amyloid or retinoic acid on a cell. The present sequence represents a synthetic constituent peptide of colostrinin, which can be used as a modulator in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recovering peptides such as colostrinin from mammalian colostrum, by mixing colostrum with alcohol to form alcohol phase containing peptides and precipitate, separating alcohol phase from precipitate, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides the sequences of a number of peptides found in ewe's colostrinin. Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disorders such as senile dementia, Parkinson's disease, Alzheimer's disease, psychosis and neurosis, immune system disorders such as bacterial and viral infections, to improve the development of a child's immune system, as a distary supplement, and to promote the dissolution of beta-amyloid plaques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

the invention fractive to an isolated muchael actd comparising any one or the invention fractive to an inspecification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated contained to polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular compound that influences the activity of the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular or proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway or equired for the proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiting a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation to. isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids

C required for proliferation to. isolate candidate molecules for rational required for proliferation and proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation as a serventy and the remaining the proposed and the remaining the required for proliferation as a servent servent servent servent servent servent sequences or a servent or an antional search and a servent servent servent servent servent sequences are servent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftrom vipo.int/pub/published_pct_sequences
                                               Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Haselbeck R, Ohlsen KL,

New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.

Disclosure; SEQ ID NO 5086; 193pp; English.

```
The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in the polynucleotides can be used to detect the presence of E. faecalis in diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human protein useful for treating neurological disease Seq 1962.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to molecules and the encoded proteins thereof. Specifically, it refers to come are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as attribodies, antibodies, antib

This invention relates to novel protein modification and maintenance molecules (PMMM) and polymucleotides which identify and encode PMMM. The invention may be useful for the development of compositions with a cytostatic, antiarteriosclerotic, anticonvulsant, nootropic, cytostatic, antiarteriosclerotic, anticonvulsant, nootropic, antiallergic, antimicrobial, antiinflammatory, endocrine-Gen or thyromimetic activity. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of PMMM, such as cell proliferative (for example cancer, atherosclerosis), neurological (for example pilepsy, Huntington's disease, stroke), immune/inflammatory (for example AIDS, allergies) and developmental (for example Hypothyroidism, Cushing's syndrome) disorders, or infections. These are also useful in assessing the effects of exagenous compounds on the expression of nucleic acid and amino acid sequences of PMMM. The present sequence is that of a human PMMM protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human protein modification and maintenance molecules (PMVM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMVM expression e.g. cancer, AIDS, epilepsy, or

Interpretation in the treatment of the polymental control activity elating to cytokine, cell proliferation or cell differentiation or which may induce cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymeptides are useful in gene therapy, vaccines or peptide therapy. The polymeptides have various cytokine-like activities, e.g. seem cell growth factor activity, immunomodulatory activities activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, archritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

Sequence 15435, Application US/09248796A

Patent No. 6747130

GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NOTEEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: WUMBER: US/09/248,796A

CURRENT APPLICATION NUMBER: US 60/074,725

PRIOR FILING DATE: 1998-02-13

PRIOR FILING DATE: 1998-02-13

PRIOR FILING DATE: 1998-02-13

PRIOR FILING DATE: 1998-06-13

NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 15435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          APPLICANT: COPELAND, WILLIAM C.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Published Applications AA:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
